

# QA Automation Engineer

1.

**Test: Verify that the results match the selected criteria**

Use <https://www.airbnb.com/> Click on “Anywhere”(top-center of the page)

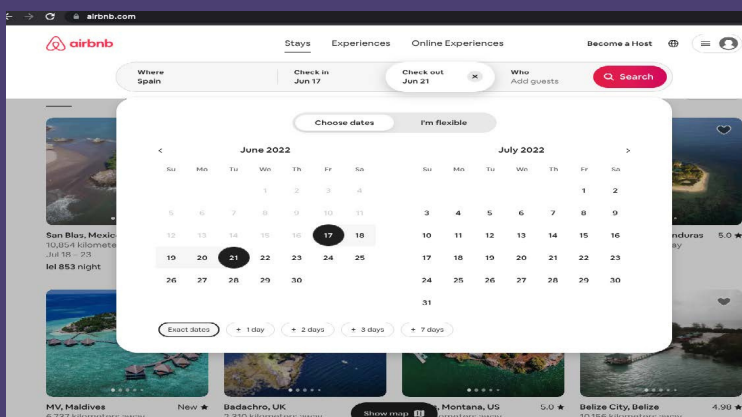

2.

☐ Input “Spain” in “Where” input field

☐ Select “Spain” from the auto-completed dropdown-list (which appears after you type Spain)

☐ Complete the “Check in”/“Check out” start/end date from the calendar with an interval-which includes the current date plus 4 more days (for e.g 17 June - 21 June as interval section)

3.

☐ Check that the interval is selected

☐ Also check that the date before the interval(in this case 16) is disabled; after that continue with the below steps

5.

☐ Click on “Choose dates” within the calendar

☐ After that click on “Search”

☐ Hover over the first card

☐ Check that on the map, the price is highlighted for the hovered card;

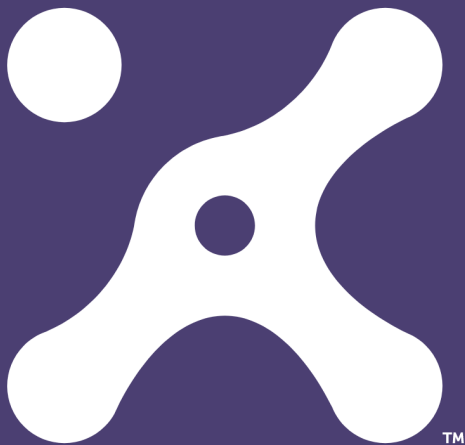

6.

**Test: Verify that the property displayed on the map matches some characteristics**

☐ Click on the price tag specific for the first hovered card (on the map)and check the following

☐ Check the name, the price and the rating within the card; after that continue with the below steps

7.

Verify that the selected filters number is reflected on the listing and the results are matching the filtered criteria

Close the card

Go to “Filters”, click on it

For the “Type of place”, select Entire Place/Private room

For the “Type of place”, select Entire Place/Private room

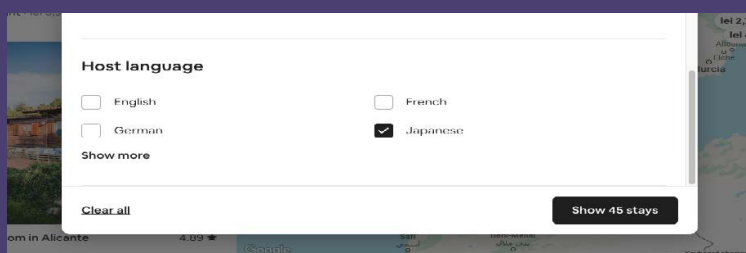

8.

For the ‘Host language’, select “Japanese”

Click on “Show <no.> stays” button (no in this case is 45>> Show 45 stays)

Check that the total number of stays from the left-side of the page(top) matches the listed stays from each page(by navigating through each page). Also check that “Filters” has changed its status(a 3 is displayed there)- for e.g. you have 45 stays, so on each page , you might have 10 or more items per page which should be added to give you the total of 45

Thank You

Note: The above images are just an example, maybe the results will be different for you, when you go through the steps
